GOOD FUNGUS?

Microscopic networks on a global scale

Mycorrhizal fungi live on the roots of plants. It is a symbiotic relationship where both parties benefit. Massive colonies can support life of entire forests. Construction, site disruption and unbalanced landscapes are typically void of these essential fungi. By incorporating strains of mycorrhizae, beneficial bacteria and other micro organisms we can reclaim and enrich soil into holistic, root zones.

I have decades of experience with our stubborn soils. Sites can vary dramatically from tree to tree on the same property. I am progressive in diagnosis and application. I offer many bio treatment regimens and special care is taken to evaluate, test and formulate a solution for optimal soil health, ultimately growing a vibrant plant. Working with nature as a guide.
